

Mobile Phone Sales & Customer Analytics

Power BI Portfolio Project Report

Dataset: 3,835 transactions | **Period:** Oct 09, 2021 – Oct 08, 2024 | **Brands:** 5 | **Models:** 15 | **Cities:** 19

1. Executive Summary

The dataset contains 3,835 transactions and 19,150 units sold, generating \$769,204,987.97 in calculated sales. The dashboard is designed as an interactive descriptive analytics view covering product, geographic, payment, customer-rating, and time dimensions. The dashboard KPI labeled 'Average' corresponds to an average price per unit of approximately \$40,114.04 when calculated from the source fields.

2. KPI Definitions

Metric	Definition	Value
Total Sales	SUM(Units Sold × Price Per Unit)	\$769,204,987.97
Total Units	SUM(Units Sold)	19,150
Transactions	Distinct Transaction ID count	3,835
Average Price / Unit	AVERAGE(Price Per Unit)	\$40,114.04
Average Sales / Transaction	AVERAGE(Units Sold × Price Per Unit)	\$200,574.96

3. Brand Performance

Brand	Sales	Units	Transactions	Avg Price
Apple	\$161,615,730	3,932.0	783.0	\$40,997
Samsung	\$160,038,054	3,923.0	775.0	\$40,344
OnePlus	\$153,719,439	3,830.0	768.0	\$40,042
Vivo	\$150,078,428	3,801.0	766.0	\$39,436
Xiaomi	\$143,753,337	3,664.0	743.0	\$39,718

Apple has the highest calculated sales among the five brands at \$161,615,730, while Xiaomi has the lowest at \$143,753,337. This is a descriptive ranking of the provided transaction data, not a causal explanation of brand performance.

4. Geographic Performance

Delhi is the largest city by calculated sales at \$203,883,476, followed by Mumbai at \$127,191,280. The concentration should be interpreted together with transaction counts because sales depend on both transaction volume and transaction value.

5. Payment Method Mix

Payment Method	Sales	Transactions
UPI	\$201,673,762	1,011.0
Debit Card	\$195,738,781	948.0
Credit Card	\$186,698,480	947.0
Cash	\$185,093,965	929.0

6. Customer Ratings

The dataset contains 1,488 transactions with a rating of 5, the largest rating group. Ratings of 4 and 5 together account for 2,331 of 3,835 transactions (60.8%). This describes the observed rating distribution; it does not

establish that ratings caused sales.

7. Time Analysis

The data spans October 2021 through October 2024. 2021 and 2024 are partial years, so direct full-year comparisons with 2022 and 2023 are not equivalent. The dashboard's day/month views are useful for identifying descriptive patterns in the available records.

8. Portfolio Takeaways

- The dashboard provides a single interactive view of revenue, volume, product, market, payment, rating, and time dimensions.
- The data model can be represented as a transaction fact table supported by date, brand, city, payment-method, and mobile-model dimensions.
- The project demonstrates the ability to translate raw transaction data into business-facing KPIs and interactive visual analysis.
- The most important limitation is that the dataset is descriptive and does not contain variables needed to establish profitability, margin, marketing spend, inventory, or causal drivers.

9. Recommended Next Analysis

A subsequent iteration could add profit/margin, inventory availability, promotion/discount information, customer repeat behavior, acquisition source, and product cost. Those fields would support more advanced business questions beyond descriptive sales reporting.
